

Partial Persistent Data-structure

Pointer Machine Model

PROJECT MEMBERS: ANANNYO DEY, SOUMYAJIT RUDRA SARMA, DEBASMIT ROY, KANKO GHOSH AND KUSHAL DAS

Ephemeral Linked List

Operations:

- `start = init()` : To initiate linked list and “start” pointer holds the starting position
- `add(x, y)` : Add new node x after y
- `remove(x)` : Remove node x
- `iterate_over_LL()` : Iterate over the whole linked list
- `update(f_i,x,val)` : Update the i-th field in node x to new value ‘val’

Ephemeral Linkedlist

Node structure

LINKED LIST

HERE IN-DEGREE OF A NODE IS ≤ 1 AND OUT-DEGREE OF A NODE IS ≤ 1

SOME OPERATIONS

update(f1,D,40)

Partial Persistent Linked List

Operations:

- `start = init()` : To initiate linked list and “start” pointer holds the starting position in `v0`
- `create_node(x, a)`: Allocate a new node `x` with `f1 = a` and `f2 = NULL`, and set its default version to current version
- `add(x, y, a)` : Add new node `x` with value = `a` after `y` and update the version
- `remove(x)` : Remove node `x` and update the version
- `iterate_over_LL(v)` : Iterate over the whole linked list in version `v`
- `update(f_i, x, val)` : Update the `i`-th field in node `x` to new value ‘`val`’ and update the version

Interesting thing!

add(x,y) and remove(x) are not Elementary operations

add(X,C,123) consists of

Create node X with value 123
Modify f2 of A to X : update(f2, A, X)
Modify f2 of X to B : update(f2, X, B)
Set BP of X to A: X.bp = A
Set BP of B to X: B.bp = X
Set f1 of X(optional)

remove(x) consists of

Modify F2 of Parent C (i.e., X) -> F2 of C (successor of C)

update(f2, A, B)
Set BP of B to A: B.bp = A
If all shared reference of X is removed Then free up the memory associated with X

Elementary Operations:

- `start = init()`

- `create_node(x, a)`

- `iterate_over_LL(v)`

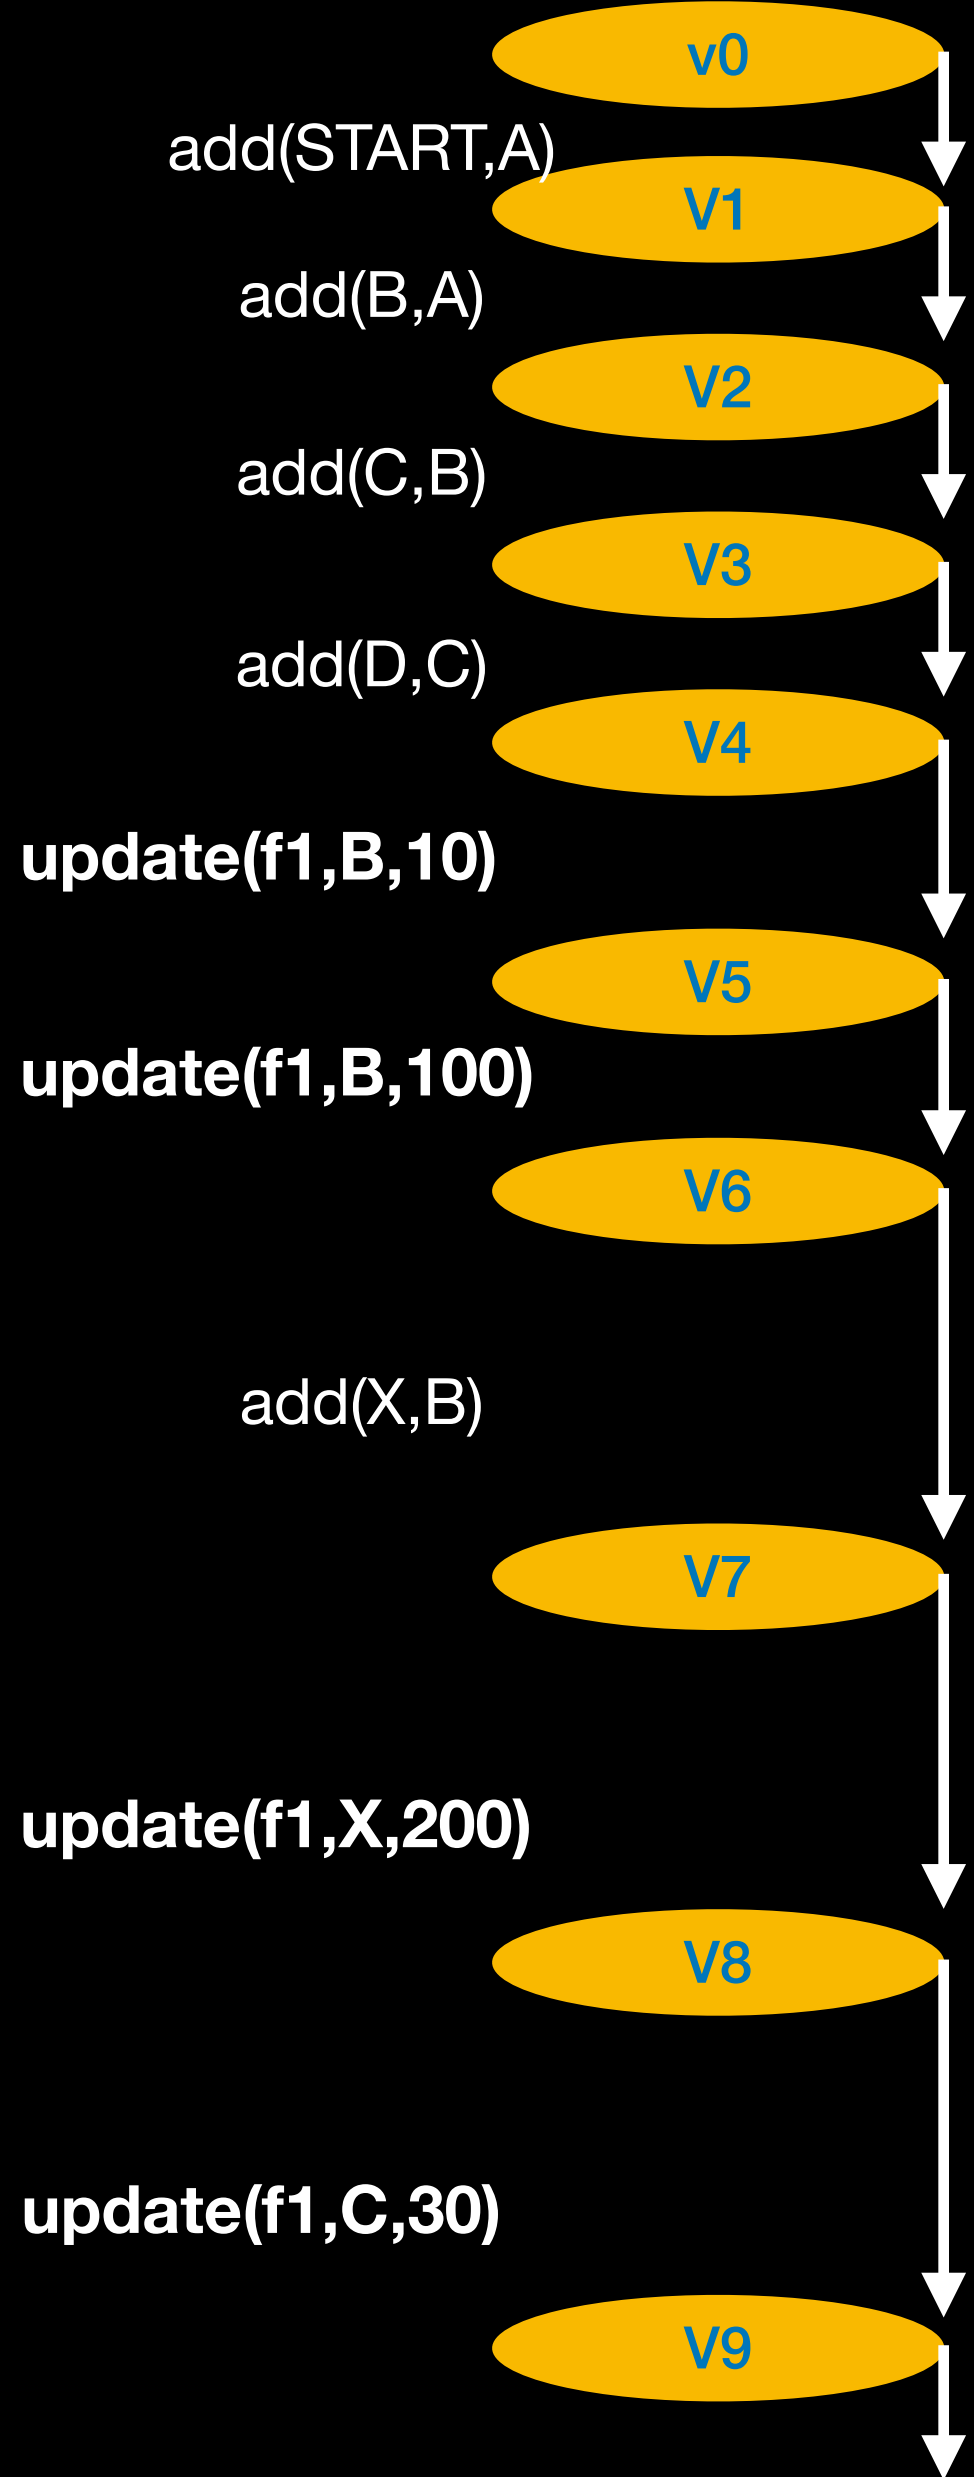

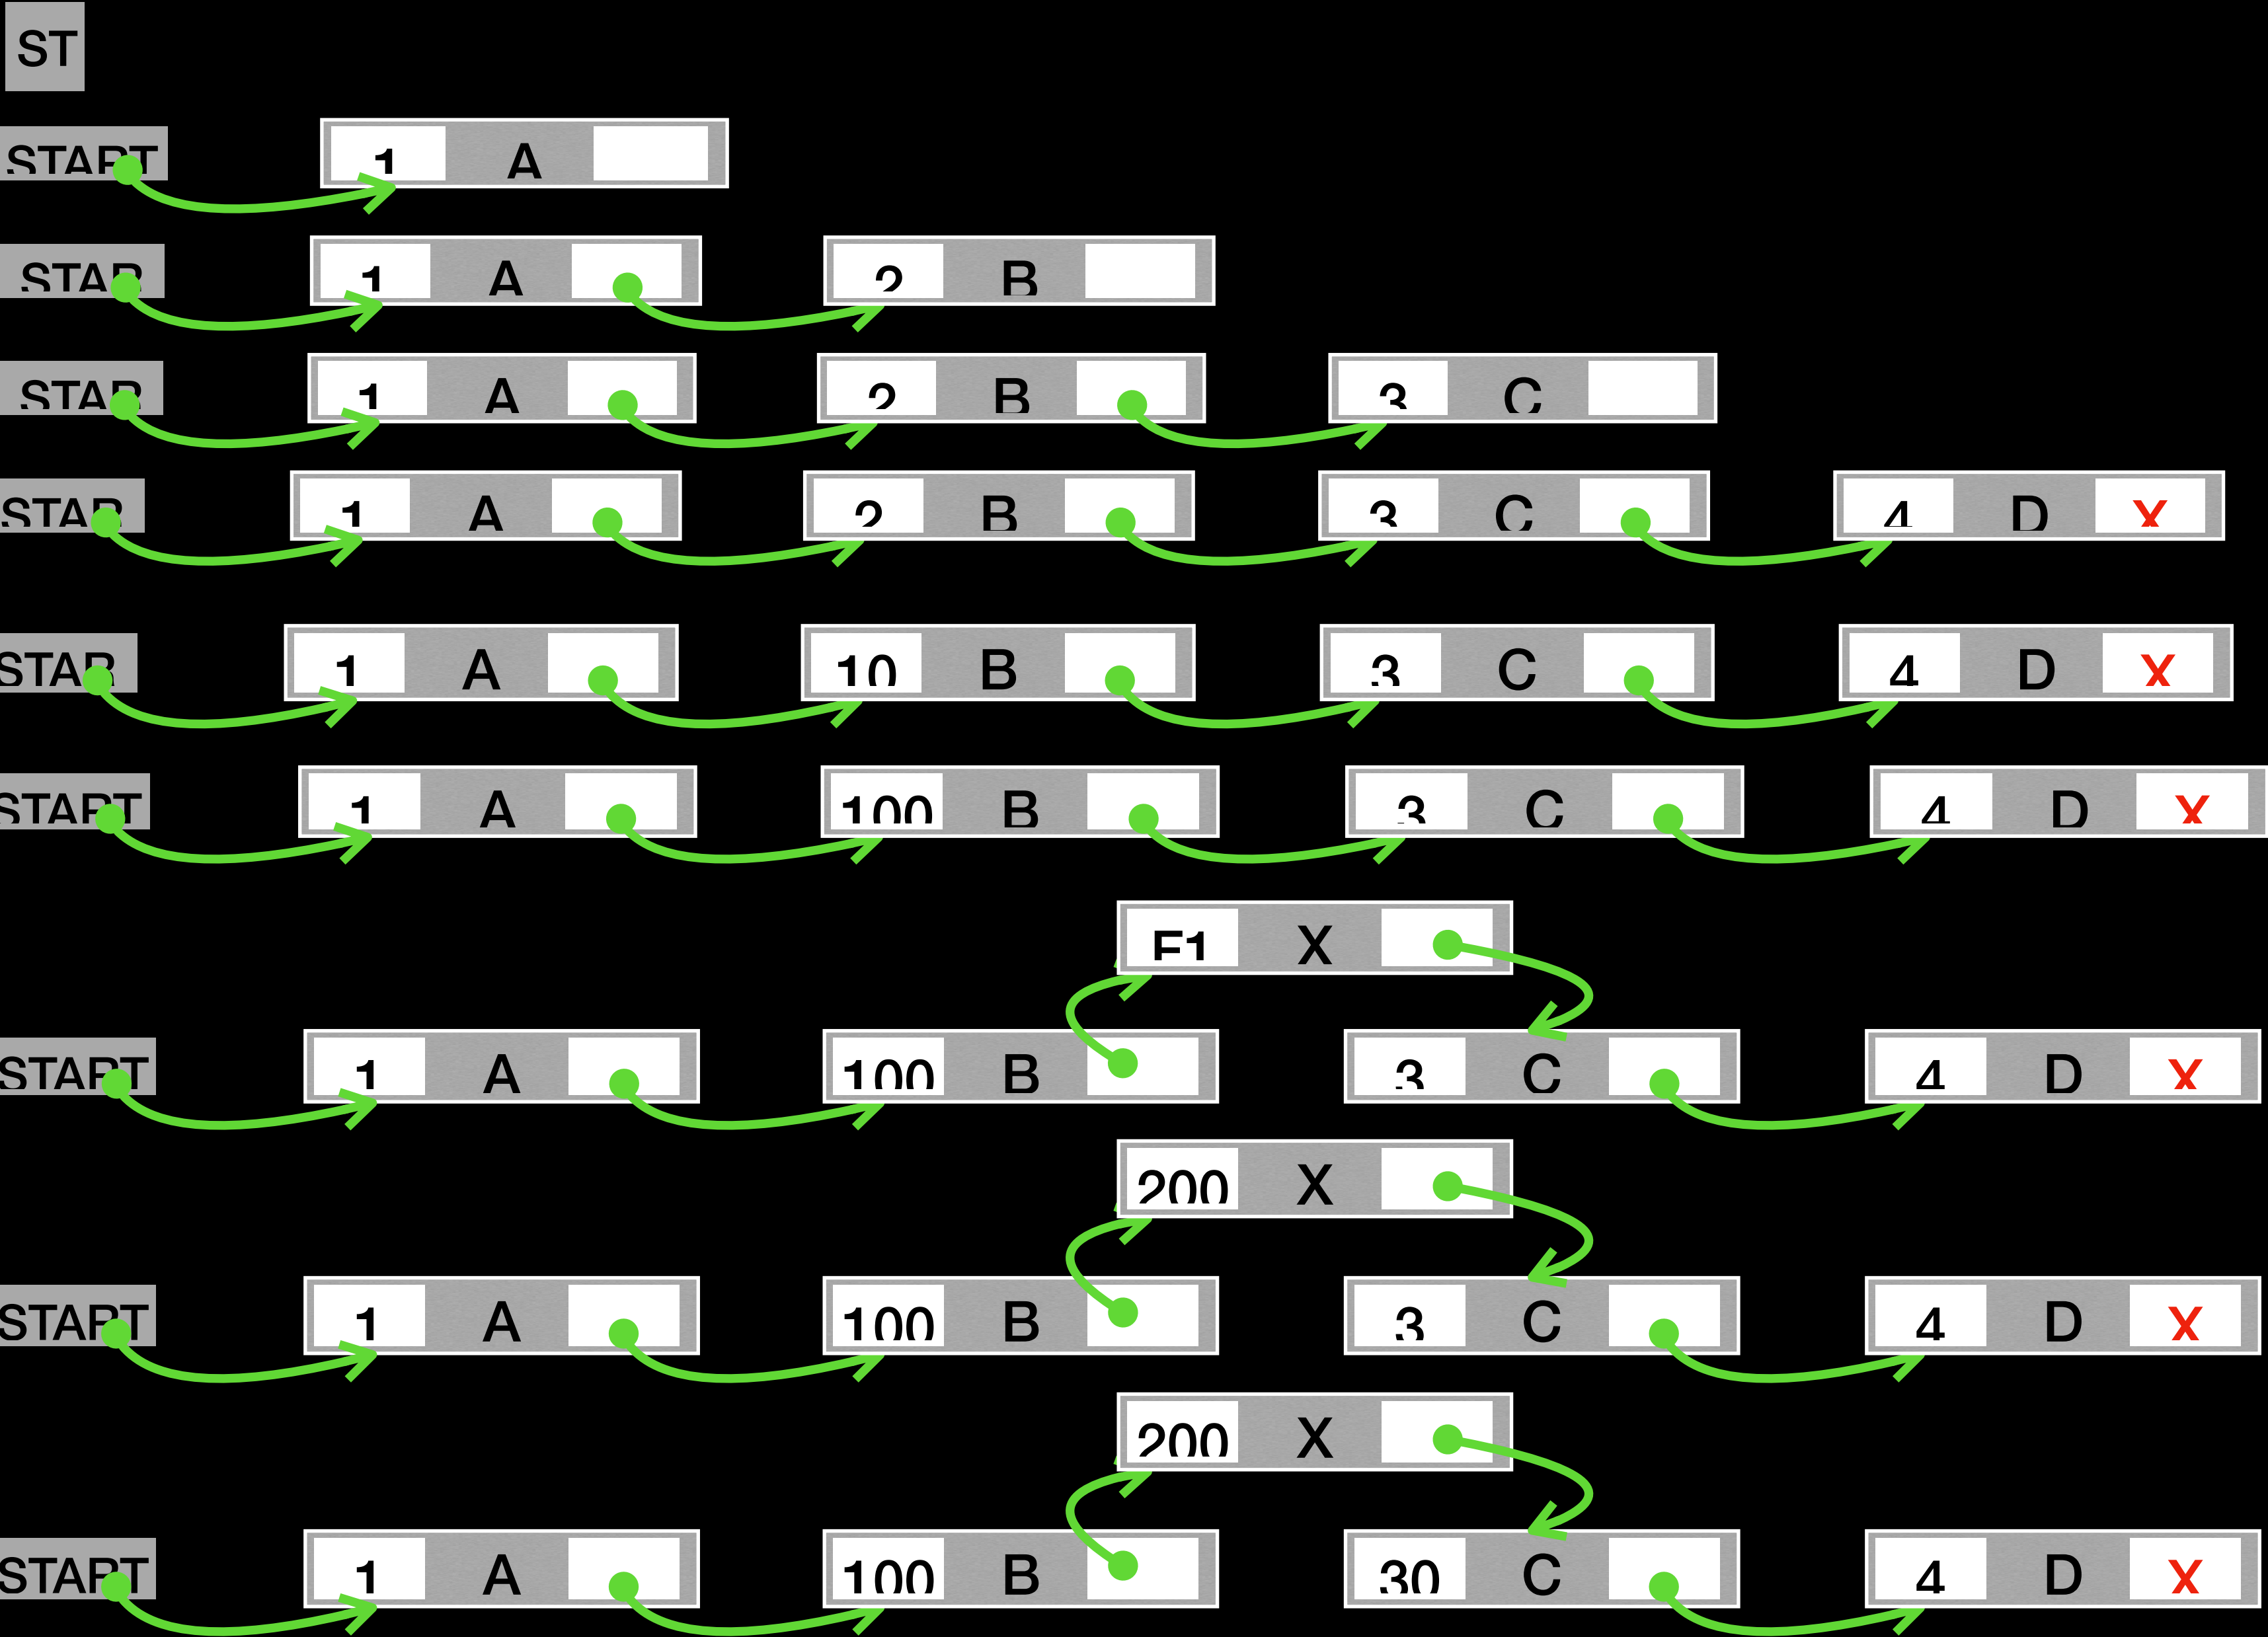

- `update(f_i,x,val)`

Persistent Linked List

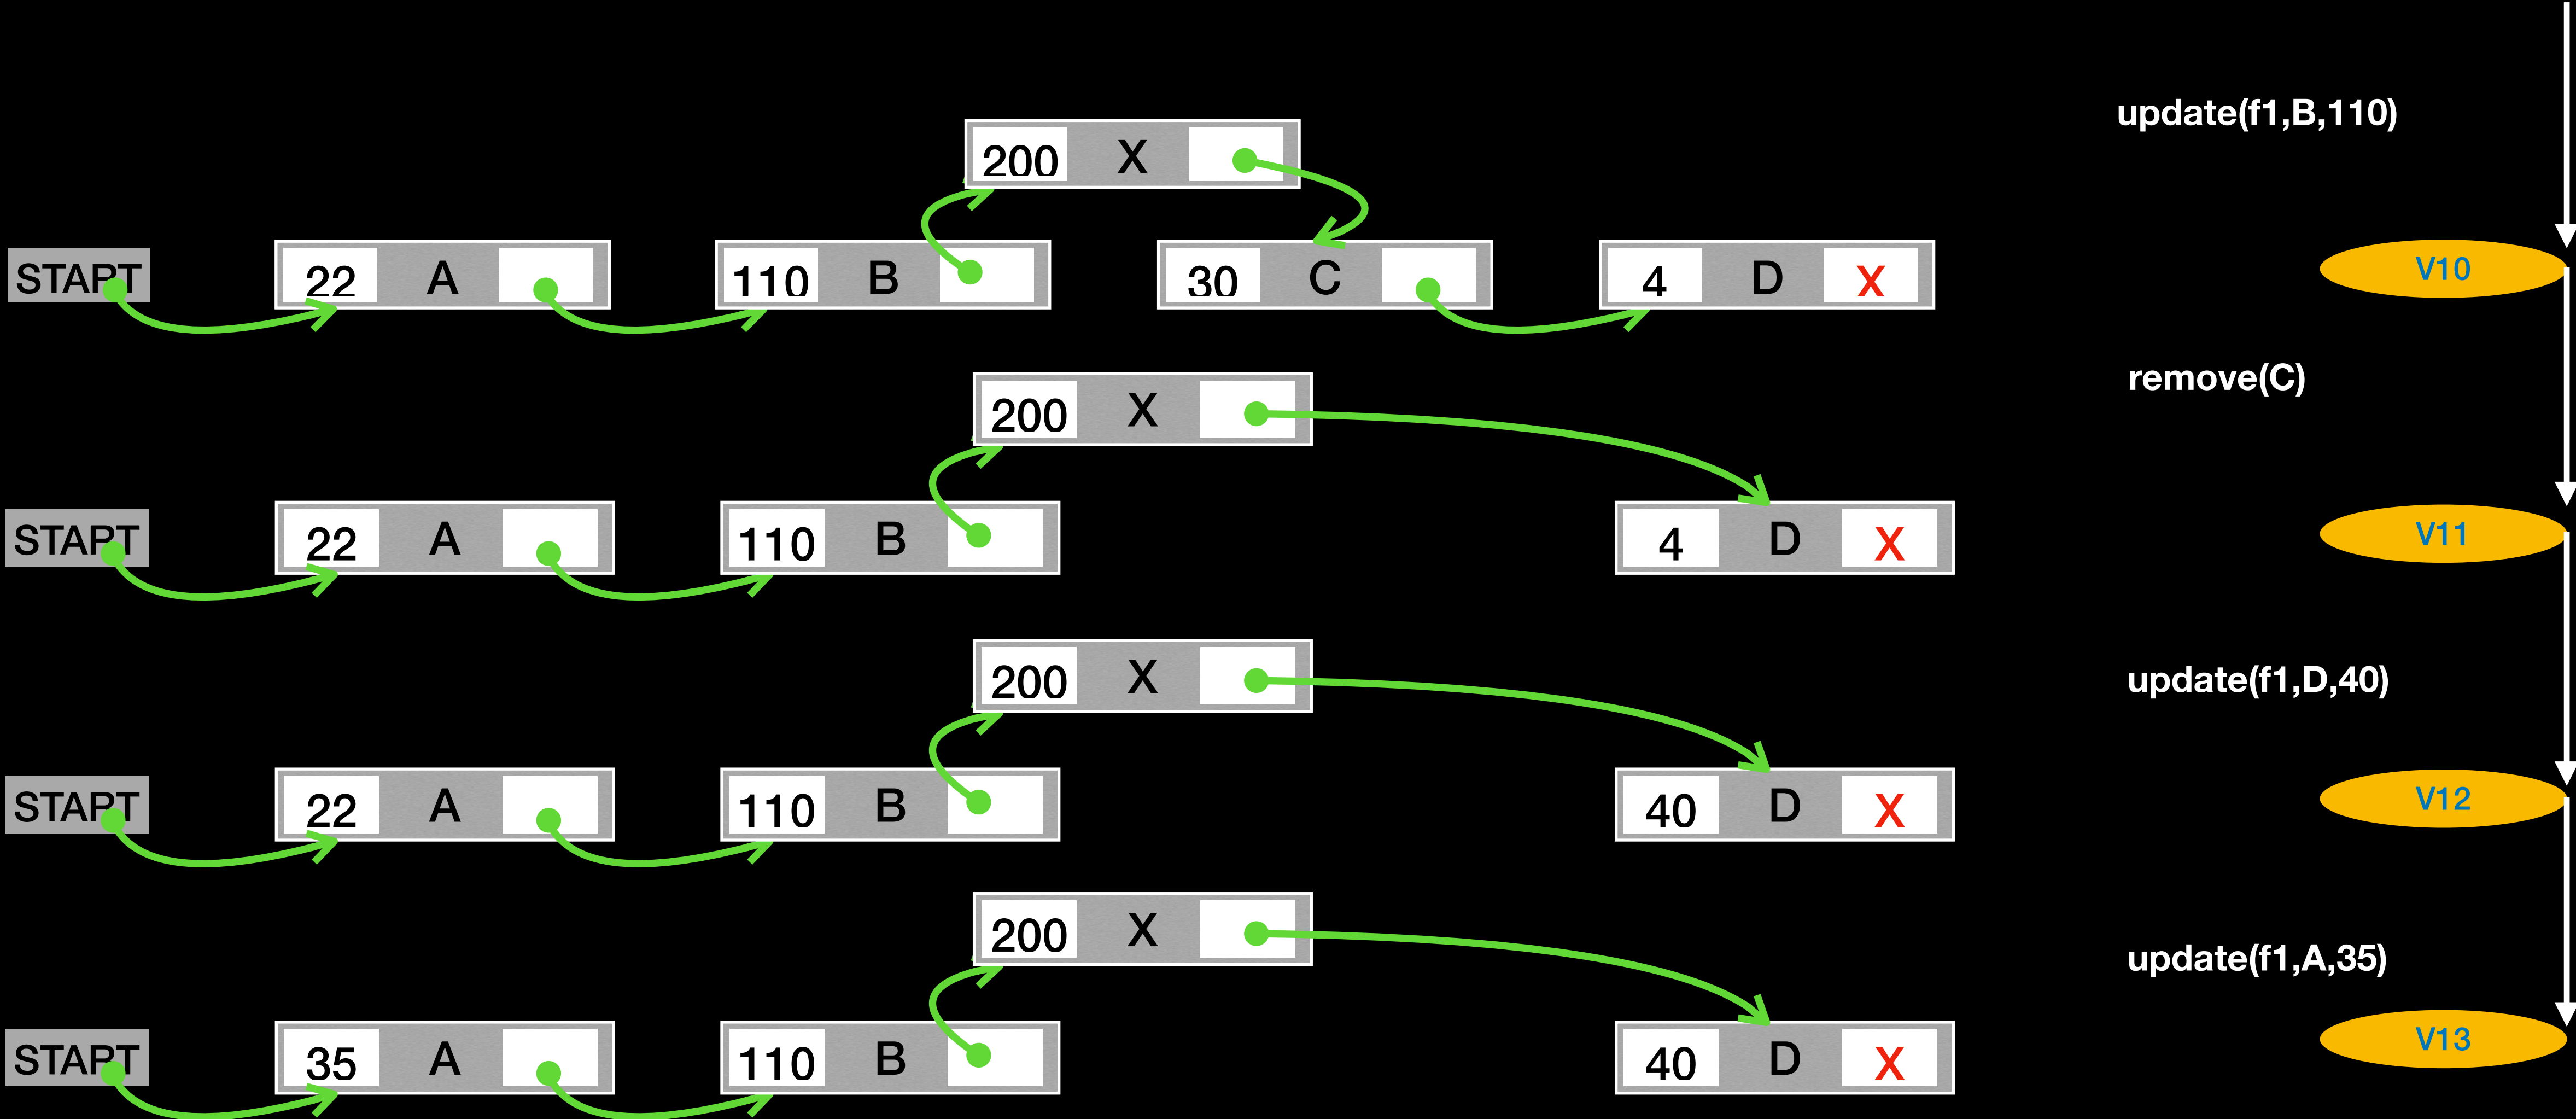

Node

iterate_LL_at_v(vx)

To print the list at v_x

- Start from start module
- Choose those lines whose version **IS JUST LESS THAN OR EQUAL TO** v_x (as, suppose if we are traversing for v5 , either v0,v1,v2,v3, v4 or v5 can be on that path, lines>v5 can't be on that).
- The word “JUST LESS” is written because if a NODE has two version lines in that, e.g. v2 and v4 and we are searching for v5, then we should prefer v4 line over v2.

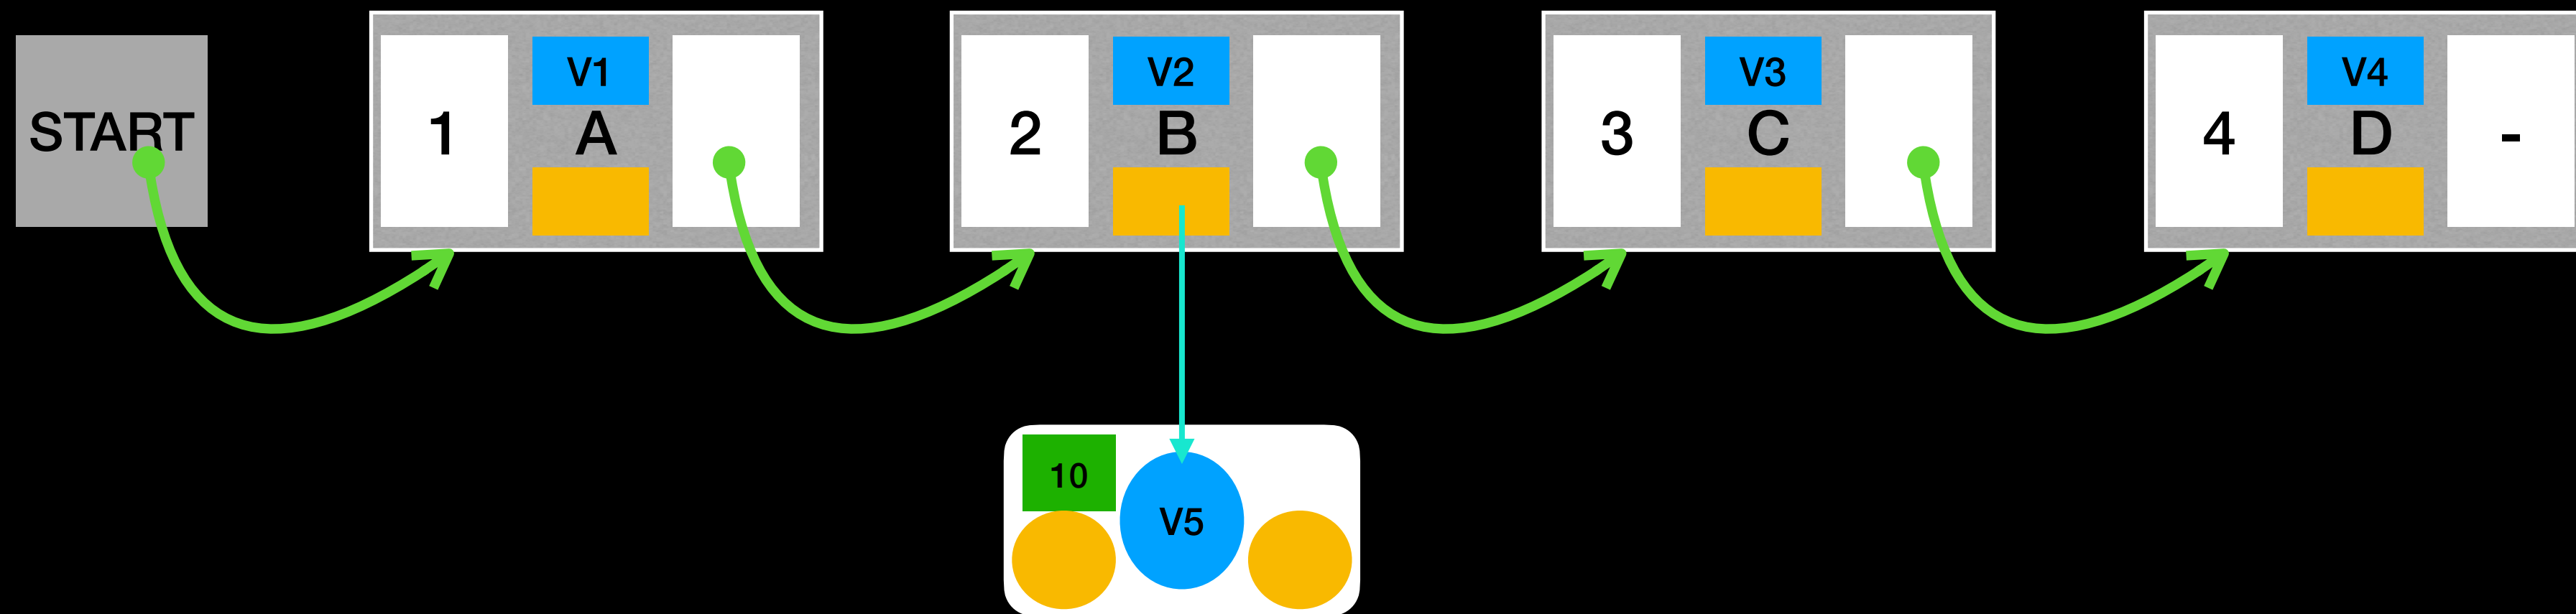

Why such approach is better ? 🥲

Normal Implementation (using balanced BST [may use just LL])

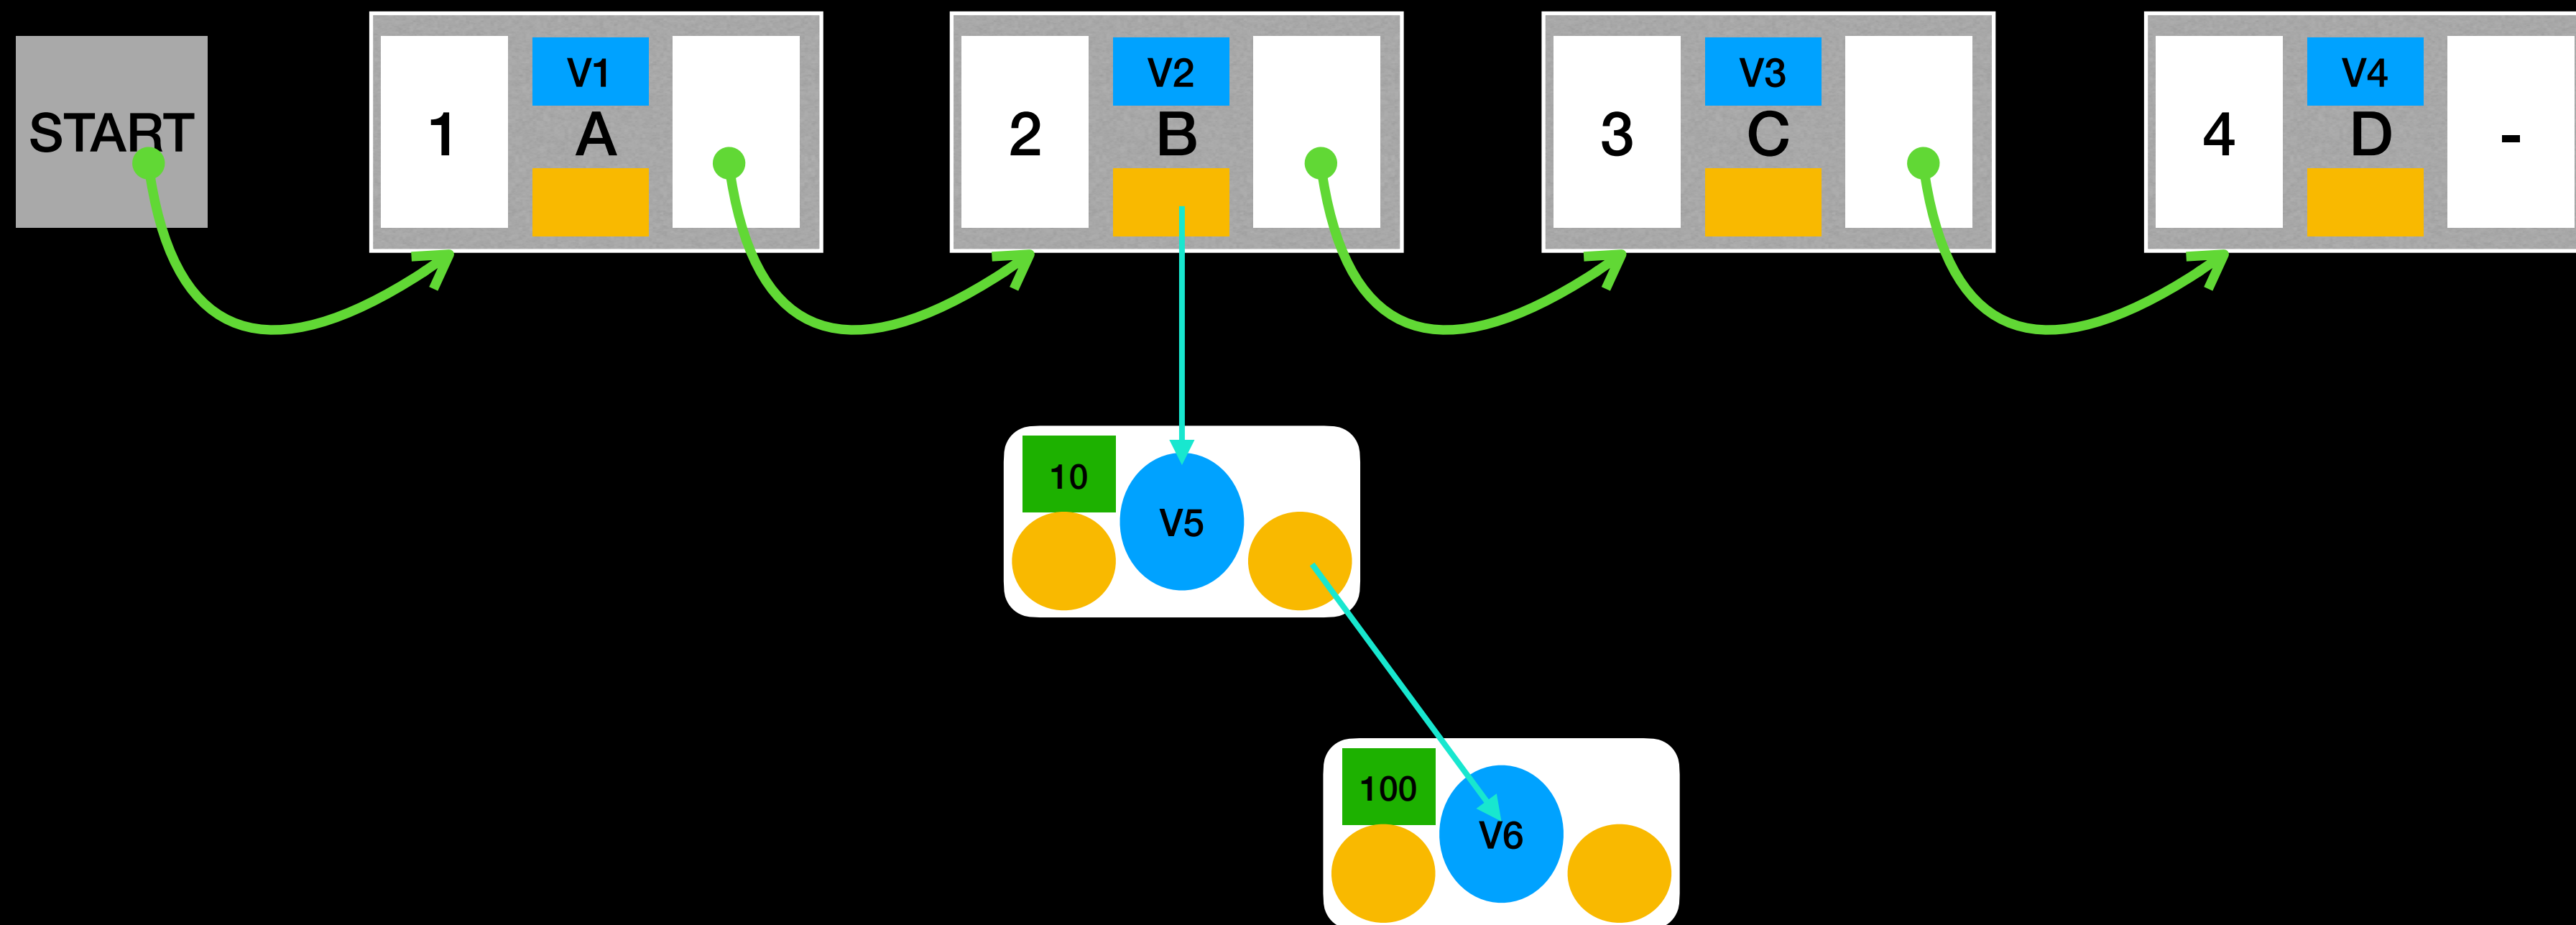

Why such approach is better ? 🥲

Normal Implementation (using balanced BST)

Why such approach is better ? 🥲

Normal Implementation (using balanced BST)

Why such approach is better ? 🥲

Normal Implementation (using balanced BST)

Why such approach is better ? 🥲

Normal Implementation (using balanced BST)

Why such approach is better ? 🥲

Normal Implementation (using balanced BST) (Reading v9)

Output: 1 -> 100 -> 30 -> 4

Note: I have not considered the Deletion and Insertion operation Here (But, this is not relevant To understand the performance)

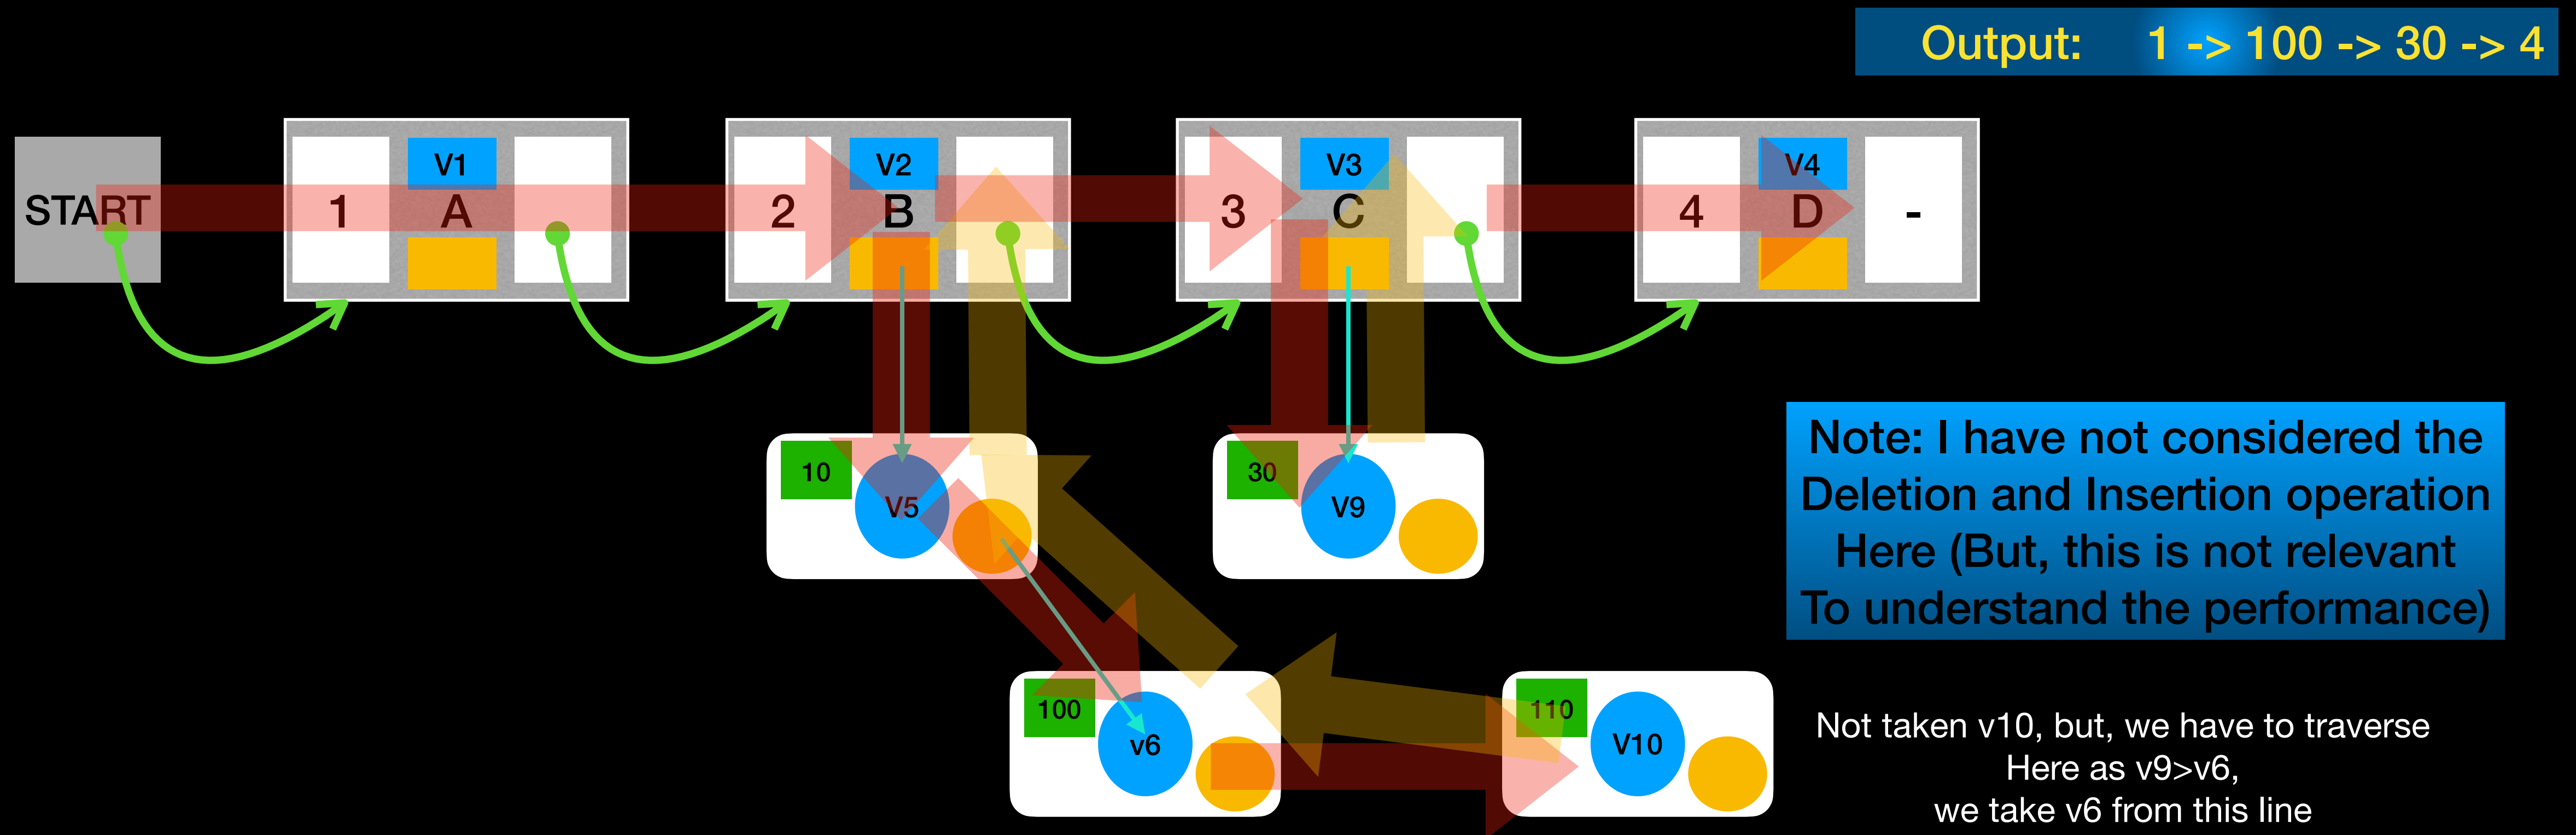

Not taken v10, but, we have to traverse Here as $v9 > v6$

So, the time complexity of reading list v9 ... $n * O(\log m)$
n is length of LL and m is #mods per node

Also the creation of the AVL of version to node
Takes $O(\log m)$ each time

Why such approach is better ? 🥲

Normal Implementation (Using List) (Reading v9)

So, the time complexity of reading list v9 ... $n * O(m)$
n is length of LL and m is is #mods per node

The creation of the List of version to node
Takes $O(1)$ each time

Why such approach is better ? 🥲

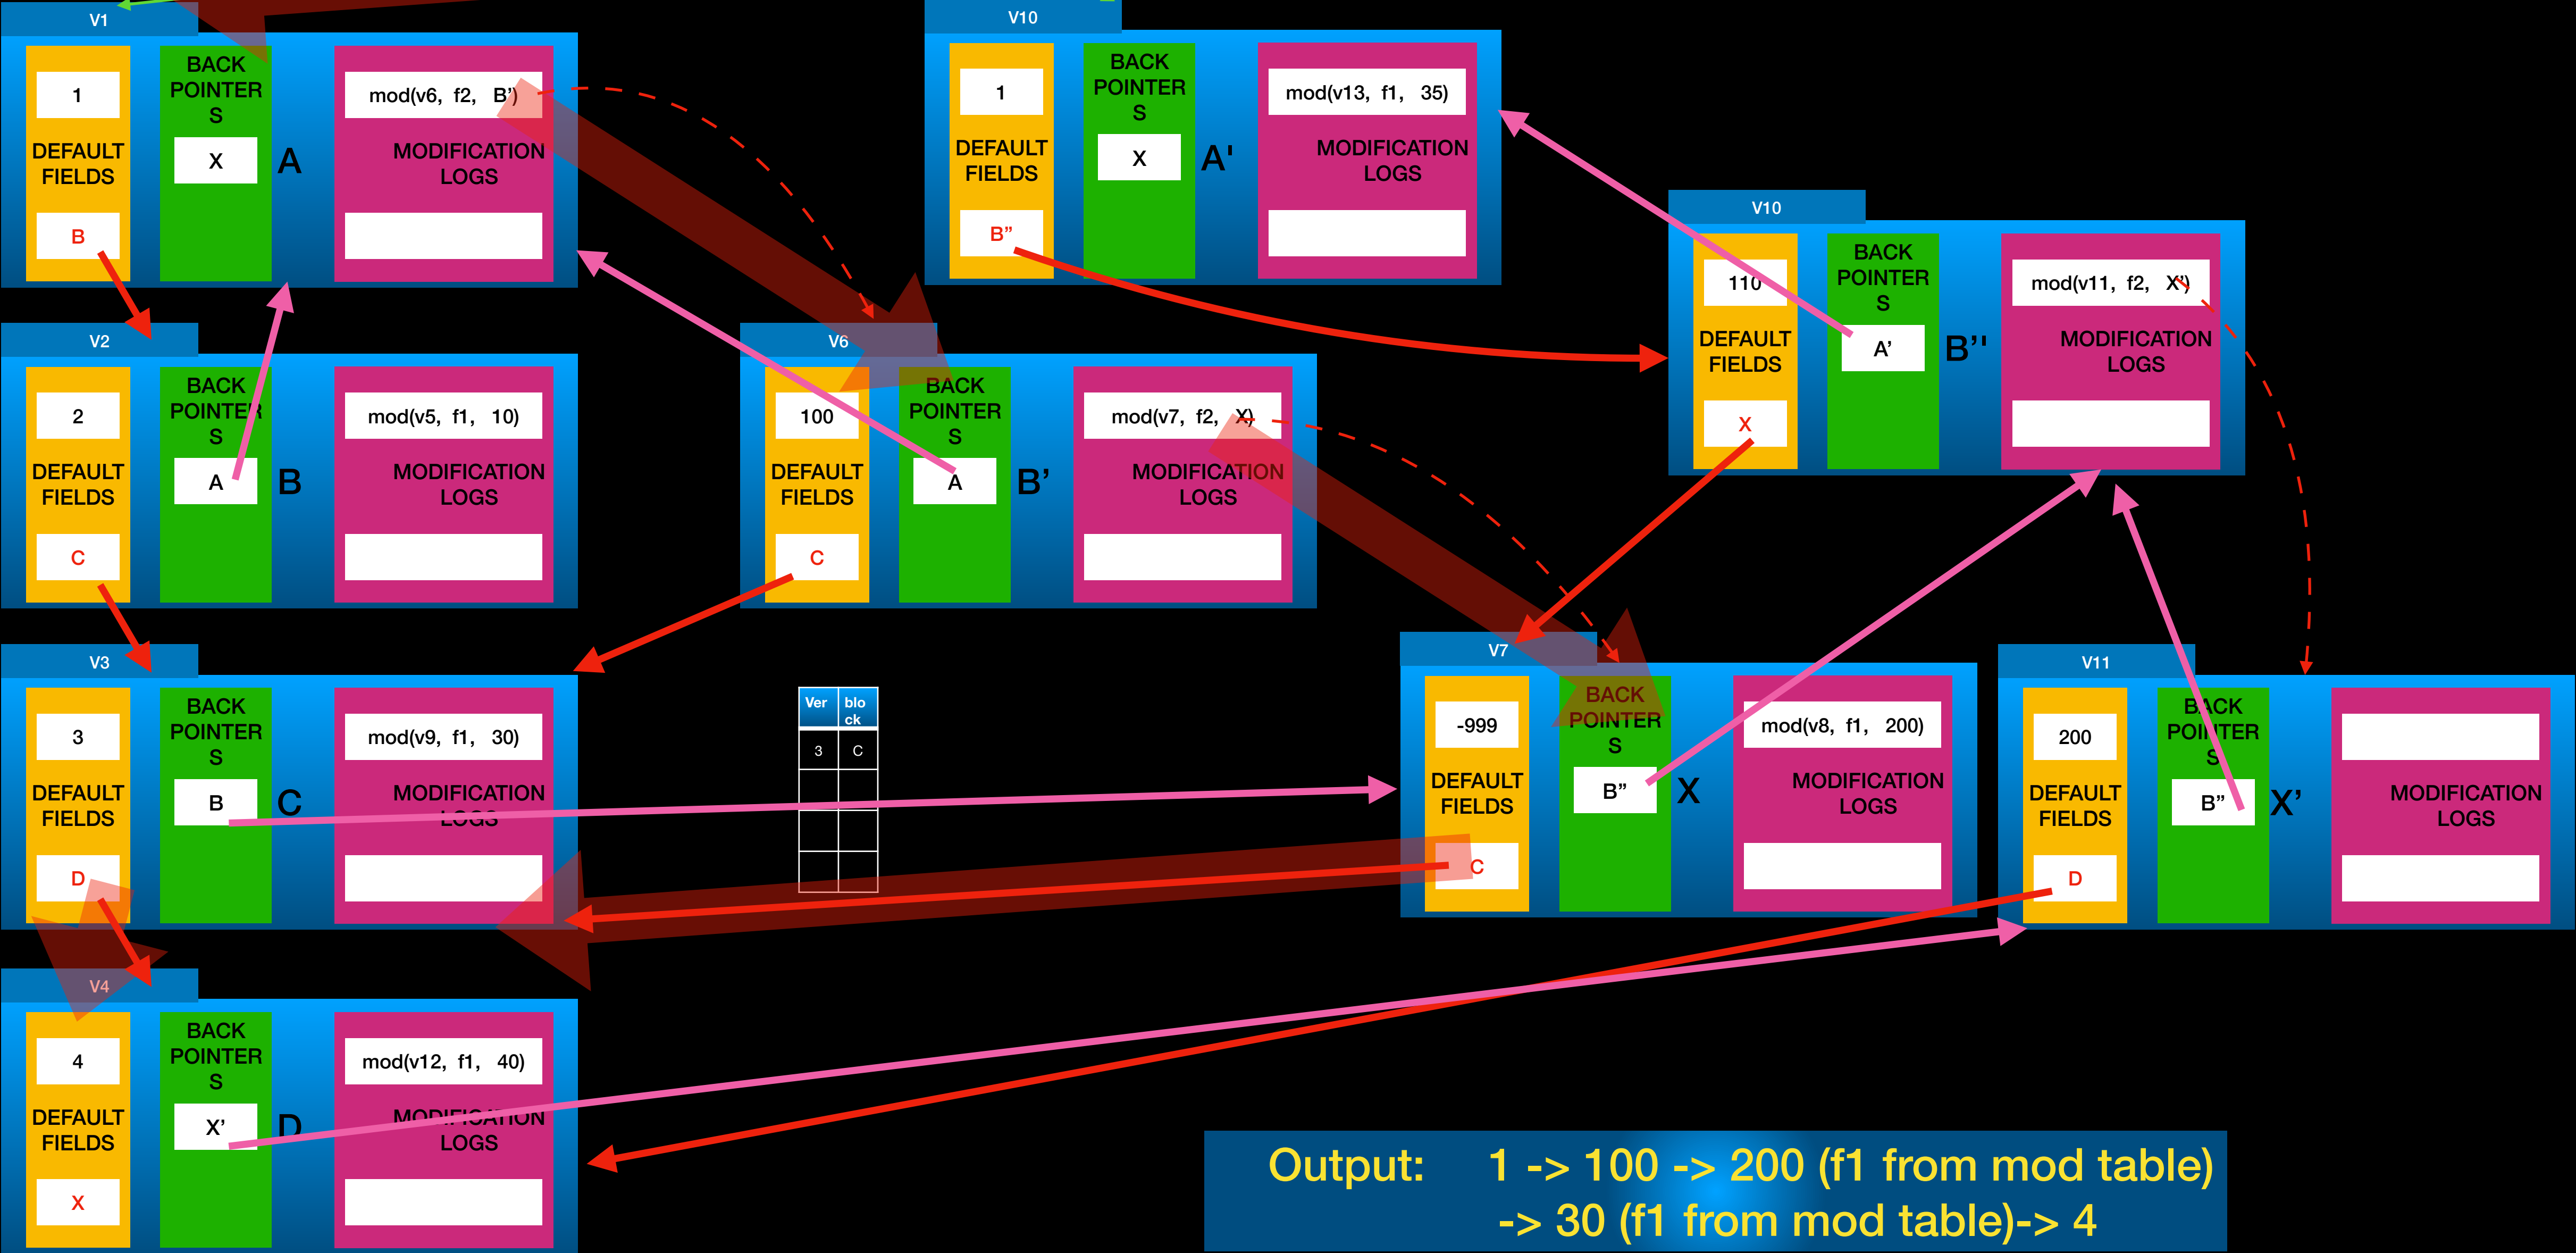

Pointer Machine (Reading v9)

We are taking $O(2k.n) \rightarrow O(n)$ time for iterating over the Linked List
Here k is the in-degree (Here 1) of the DS

We are taking $O(2)$ amortised time for modifying/adding each node to the Linked List
Here k is the in-degree (Here 1) of the DS
